NAME

rgbasm — Game Boy assembler

SYNOPSIS

```
rgbasm[-EVvw][-b chars][-D name[=value]][-g chars][-I path]
    [-M depend_file][-MG][-MP][-MT target_file][-MQ target_file]
    [-0 out_file][-P include_file][-p pad_value][-Q fix_precision]
    [-r recursion_depth][-s features:state_file][-W warning]
    [-X max_errors] asmfile
```

DESCRIPTION

The **rgbasm** program creates an RGB object file from an assembly source file. The object file format is documented in *rgbds*(5).

The input *asmfile* can be a path to a file, or – to read from standard input.

Note that options can be abbreviated as long as the abbreviation is unambiguous: --verb is --verbose, but --ver is invalid because it could also be --version. The arguments are as follows:

-b chars, --binary-digits chars

Change the two characters used for binary constants. The defaults are 01.

- -D name[=value], --define name[=value] Add a string symbol to the compiled source code. This is equivalent to name EQUS "value" in code, or name EQUS "1" if value is not specified.
- -E, --export-all

Export all labels, including unreferenced and local labels.

-g chars, --gfx-chars chars

Change the four characters used for gfx constants. The defaults are 0123.

-I path, --include path

Add a new "include path"; *path* must point to a directory. When a **INCLUDE** (including the implicit one from -P) or **INCBIN** is attempted, **rgbasm** first looks up the provided path from its working directory; if this fails, it tries again from each of the "include path" directories, in the order they were provided.

- -M depend_file, --dependfile depend_file Write make(1) dependencies to depend_file.
- -MG To be used in conjunction with -M. This makes **rgbasm** assume that missing files are auto-generated: when **INCLUDE** (including the implicit one from -P) or **INCBIN** is attempted on a non-existent file, it is added as a dependency, then **rgbasm** exits normally instead of erroring out. This feature is used in automatic updating of makefiles.
- -MP When enabled, this causes a phony target to be added for each dependency other than the main file. This prevents *make*(1) from erroring out when dependency files are deleted.
- -MT target_file Add a target to the rules emitted by -M. The exact string provided will be written, including spaces and special characters. -MT fileA -MT fileB is equivalent to -MT 'fileA fileB'.

If neither this nor -MQ is specified, the output file name is used.

-MQ target_file

Same as -MT, but additionally escapes any special make(1) characters, essentially '\$'.

- -o out_file, --output out_file Write an object file to the given filename.
- -P include_file, --preinclude include_file Pre-include a file. This acts as if a **INCLUDE** "include_file" was read before the input asmfile.
- -p pad_value, --pad-value pad_value Use this as the value for **DS** directives in ROM sections, unless overridden. The default is 0x00.
- -Q fix_precision, --q-precision fix_precision
 Use this as the precision of fixed-point numbers after the decimal point, unless they specify their own precision. The default is 16, so fixed-point numbers are Q16.16 (since they are 32-bit integers). The argument may start with a '.' to match the Q notation, for example, -Q .16.
- -r recursion_depth, --recursion-depth recursion_depth Specifies the recursion depth past which **rgbasm** will assume being in an infinite loop. The default is 64.
- -s features:state_file, --state features:state_file

Write the specified *features* to *state_file*, based on the final state of **rgbasm** at the end of its input. The expected *features* are a comma-separated subset of the following:

- equ Write all numeric constants as **def** name **equ** value.
- var Write all variables as **def** name = value.
- equs Write all string constants as def name equs "value".
- char Write all characters as **charmap** name, value.
- macro Write all macros as macro name ... endm.
- all Acts like equ, var, equs, char, macro.

This flag may be specified multiple times with different feature subsets to write them to different files (see "EXAMPLES" below).

-V, --version

Print the version of the program and exit.

- -v, --verbose Be verbose.
- -W warning, --warning warning

Set warning flag *warning*. A warning message will be printed if *warning* is an unknown warning flag. See the "DIAGNOSTICS" section for a list of warnings.

-w Disable all warning output, even when turned into errors.

-X max_errors, --max-errors max_errors

If more than this number of errors (not warnings) occur, then abort the assembly process; -X = 0 disables this behavior. The default is 100 if **rgbasm** is printing errors to a terminal, and 0 otherwise.

DIAGNOSTICS

Warnings are diagnostic messages that indicate possibly erroneous behavior that does not necessarily compromise the assembling process. The following options alter the way warnings are processed.

-Werror

Make all warnings into errors. This can be negated as -Wno-error to prevent turning all warnings into errors.

-Werror=

Make the specified warning or meta warning into an error. A warning's name is appended (example: -Werror=obsolete), and this warning is implicitly enabled and turned into an error. This can be negated as -Wno-error= to prevent turning a specified warning into an error, even if -Werror is in effect.

The following warnings are "meta" warnings, that enable a collection of other warnings. If a specific warning is toggled via a meta flag and a specific one, the more specific one takes priority. The position on the command-line acts as a tie breaker, the last one taking effect.

-Wall

This enables warnings that are likely to indicate an error or undesired behavior, and that can easily be fixed.

```
-Wextra
```

This enables extra warnings that are less likely to pose a problem, but that may still be wanted.

-Weverything

Enables literally every warning.

The following warnings are actual warning flags; with each description, the corresponding warning flag is included. Note that each of these flag also has a negation (for example, -Wcharmap-redef enables the warning that -Wno-charmap-redef disables; and -Wall enables every warning that -Wno-all disables). Only the non-default flag is listed here. Ignoring the "no-" prefix, entries are listed alphabetically.

```
-Wno-assert
```

Warn when **WARN**-type assertions fail. (See "Aborting the assembly process" in *rgbasm*(5) for **ASSERT**).

-Wbackwards-for

Warn when **FOR** loops have their start and stop values switched according to the step value. This warning is enabled by -Wall.

-Wbuiltin-args

Warn about incorrect arguments to built-in functions, such as **STRSUB**() with indexes outside of the string's bounds. This warning is enabled by -Wall.

-Wcharmap-redef

Warn when re-defining a charmap mapping. This warning is enabled by -Wall.

-Wdiv

Warn when dividing the smallest negative integer (-2**31) by -1, which yields itself due to integer overflow.

-Wempty-macro-arg

Warn when a macro argument is empty. This warning is enabled by -Wextra.

-Wempty-strrpl

Warn when **STRRPL**() is called with an empty string as its second argument (the substring to replace). This warning is enabled by -Wall.

-Wlarge-constant

Warn when a constant too large to fit in a signed 32-bit integer is encountered. This warning is enabled by -Wall.

-Wmacro-shift

Warn when shifting macro arguments past their limits. This warning is enabled by -Wextra.

-Wno-nested-comment

Warn when the block comment start sequence '/*' is found inside of a block comment. Block comments cannot be nested, so the first '*/' will end the whole comment.

```
-Wno-obsolete
```

Warn when obsolete constructs such as the **_PI** constant or **PRINTT** directive are encountered.

-Wnumeric-string=

Warn when a multi-character string is treated as a number. -Wnumeric-string=0 or -Wno-numeric-string disables this warning. -Wnumeric-string=1 or just -Wnumeric-string warns about strings longer than four characters, since four or fewer characters fit within a 32-bit integer. -Wnumeric-string=2 warns about any multi-character string.

-Wpurge=

Warn when purging symbols which are likely to have been necessary. -Wpurge=0 or -Wno-purge disables this warning. -Wpurge=1 or just -Wpurge warns when purging any exported symbol (regardless of type). -Wpurge=2 also warns when purging any label (even if not exported).

```
-Wshift
```

Warn when shifting right a negative value. Use a division by 2**N instead.

```
-Wshift-amount
```

Warn when a shift's operand is negative or greater than 32.

-Wtruncation=

Warn when an implicit truncation (for example, **db** to an 8-bit value) loses some bits. -Wtruncation=0 or -Wno-truncation disables this warning. -Wtruncation=1 warns when an N-bit value is 2**N or greater, or less than -2**N. -Wtruncation=2 or just -Wtruncation also warns when an N-bit value is less than -2**(N-1), which will not fit in two's complement encoding.

-Wunmapped-char=

Warn when a character goes through charmap conversion but has no defined mapping. -Wunmapped-char=0 or -Wno-unmapped-char disables this warning. -Wunmapped-char=1 or just -Wunmapped-char only warns if the active charmap is not empty. -Wunmapped-char=2 warns if the active charmap is empty, and/or is not the default charmap 'main'.

-Wunmatched-directive

Warn when a **PUSHC**, **PUSHO**, or **PUSHS** directive does not have a corresponding **POPC**, **POPO**, or **POPS**. This warning is enabled by -Wextra.

```
-Wunterminated-load
```

Warn when a LOAD block is not terminated by an ENDL. This warning is enabled by -Wextra.

-Wno-user

Warn when the **WARN** built-in is executed. (See "Aborting the assembly process" in *rgbasm*(5) for **WARN**).

EXAMPLES

You can assemble a source file in two ways.

Straightforward way:

\$ rgbasm -o bar.o foo.asm

Pipes way:

\$ cat foo.asm | rgbasm -o bar.o \$ rgbasm -o bar.o - < foo.asm</pre>

The resulting object file is not yet a usable ROM image—it must first be run through rgblink(1) and then rgbfix(1).

Writing the final assembler state to a file:

\$ rgbasm -s all:state.dump.asm foo.asm

Or to multiple files:

\$ rgbasm -s equ,var:numbers.dump.asm -s equs:strings.dump.asm
foo.asm

BUGS

Please report bugs on *GitHub*: https://github.com/gbdev/rgbds/issues.
